

VENTURI INJECTOR

ACCESSORIES FOR JETTING/VACUUM MACHINES

Injector - Venturi

The injector consists of two components: a Venturi component and a high quality hose with a length of 7 meters. After connecting the pressure hose of the rinsing device to the Venturi component, that creates vacuum which sucks in the liquids. Thanks to this phenomenon, we can suck clean or contaminated water using the pressure pump of the devices: PYTON, KOBRA and TYTAN series. It is a perfect complement to the equipment of high-pressure cleaning machines that allows the suction of liquids.
